

Firewise Landscaping Checklist

When designing and installing a firewise landscape, consider the following:

 □ Local area fire history. □ Site location and overall terrain. □ Prevailing winds and seasonal weather. □ Property contours and boundaries. □ Native vegetation. □ Plant characteristics and placement (duffage, water and salt retention ability, aromatic oils, fuel load per area, and size). □ Irrigation requirements.
To create a firewise landscape, remember that the primary goal is fuel reduction. To this end, initiate the zone concept. Zone 1 is closest to the structure; Zones 2-4 move progressively further away.
☐ Zone 1. This well-irrigated area encircles the structure for at least 30' on all sides, providing space for fire suppression equipment in the event of an emergency. Plantings should be limited to carefully spaced low flammability species.
☐ Zone 2. Low flammability plant materials should be used here. Plants should be low-growing, and the irrigation system should extend into this section.
☐ Zone 3. Place low-growing plants and well-spaced trees in this area, remembering to keep the volume of vegetation (fuel) low.
☐ Zone 4. This furthest zone from the structure is a natural area. Selectively prune and thin all plants and remove highly flammable vegetation.
Also remember to:
 Be sure to leave a minimum of 30' around the house to accommodate fire equipment, if necessary. Widely space and carefully situate the trees you plant. Take out the "ladder fuels" — vegetation that serves as a link between grass and tree tops. This arrangement can carry fire to a structure or from a structure to vegetation. Give yourself added protection with "fuel breaks" like driveways, gravel walkways, and lawns.
When maintaining a landscape:
 □ Keep trees and shrubs properly pruned. Prune all trees so the lowest limbs are 6' to 10' from the ground. □ Remove leaf clutter and dead and overhanging branches. □ Mow the lawn regularly. □ Dispose of cuttings and debris promptly, according to local regulations. □ Store firewood away from the house. □ Be sure the irrigation system is well maintained. □ Use care when refueling garden equipment and maintain it regularly. □ Store and use flammable liquids properly. □ Dispose of smoking materials carefully. □ Become familiar with local regulations regarding vegetation clearances, disposal of debris, and fire safety requirements for equipment. □ Follow manufacturers' instructions when using fertilizers and pesticides.

FireWise Plant Materials

Fact Sheet No. 6.305

Natural Resources Series | Forestry

by F.C. Dennis*

Creating a "defensible space" around your home is one of the most important and effective steps you can take to protect you, your family and your home from catastrophic wildfire. Defensible space is the area between a structure and an oncoming wildfire where nearby vegetation has been modified to reduce a wildfire's intensity. (See fact sheet 6.302, Creating Wildfire-Defensible Zones.)

Many people resist creating defensible space around their homes because they believe these areas will be unattractive and unnatural. This is far from true. With careful planning, FireWise landscaping can be aesthetically pleasing while reducing potential wildfire fuel. It can actually enhance beauty and property values, as well as personal safety.

Many native plants are highly flammable during different seasons of the year. At such times, left unmanaged, they can accelerate the spread of a wildfire through your neighborhood, threatening homes, property and lives.

All vegetation, naturally occurring and otherwise, is potential fuel for fire. Its type, amount and arrangement has a dramatic effect on fire behavior. There are no truly "fireproof" plant species, so plant choice, spacing and maintenance are critical to defensible space landscaping. In fact, where and how you plant may be more important than what you plant. However, given alternatives, choose plant species that tend to be more resistant to wildfire.

General concepts to keep in mind when choosing and planting FireWise species are:

 A plant's moisture content is the single most important factor governing its volatility. (However, resin content and other factors in some species render them flammable even when the plant is wellwatered.) Conifers tend to be flammable due to their oil and pitch content, regardless of their water content.

*Staff Forester (retired), Colorado State Forest Service

 Deciduous plants tend to be more fire resistant because their leaves have higher moisture content and their basic chemistry is less flammable. Also, when deciduous trees are dormant, there is less fuel to carry fire through their canopies.

In some cases, there is a strong correlation between drought tolerance and fire resistance. For example, a plant may shed its leaves or needles during extreme drought. Other drought-tolerant species may have smaller leaves or thick, succulent leaves. These plants offer less fuel or have a higher moisture content, both of which help reduce fire hazard.

There also appears to be a correlation between a plant's salt tolerance and natural fire resistance. Plants adapted to salty conditions, and actually growing in salty situations, may better resist burning.

Plants for a FireWise Landscape

Plants that are more resistant to wildfire have one or more of the following characteristics:

- They grow without accumulating large amounts of combustible dead branches, needles or leaves (example: aspen).
- They have open, loose branches with a low volume of total vegetation (examples: currant and mountain mahogany).
- They have low sap or resin content (examples: many deciduous species).
- They have high moisture content (examples: succulents and some herbaceous species).
- They grow slowly and need little maintenance (do not need frequent pruning).
- They are short and grow close to the ground (examples: wildflowers and groundcovers).
- They can resprout following fire, thus reducing relandscaping costs (example: aspen).

Quick Facts

- FireWise landscaping can be aesthetically pleasing while reducing potential wildfire fuel.
- Plant choice, spacing and maintenance are critical.
- Your landscape, and the plants in it, must be maintained to retain their FireWise properties.

FireWise Plant List

The following list was prepared by Phil Hoefer (retired) Colorado State Forest Service. It was reviewed by Jim Knopf, a landscape architect in Boulder, and two landscape architects on Colorado's Western Slope. Bloom time is approximate (observed in Boulder at 5,600 feet).

Key:

Water needs: $VL = very low \quad L = low \quad M = medium \quad H = high Sun/Shade: \quad S = sun \quad PS = part sun \quad Sh = shade$

Elevation: $Y = Yes \quad N = No \quad ? = Questionable or unknown$

		Approx.		Approx. Mature	Elevatio (1,000 ft	Approx. Bloom

^a Native species.

^b Ground cover plant.

^c This species, or some species in this genus, may be poisonous to livestock, pets, wildlife and/or people under some conditions.

Before planting, check with Colorado State University Extension, Colorado State Forest Service, or other knowledgeable personnel.

^d Several species of symphoricarpos are native.

Additional FireWise Guidelines

Some additional tips to follow when planning a FireWise landscape include:

- Landscape according to the recommended defensible-space zones.
 The plants nearest your home should be more widely spaced and smaller than those farther away.
- Plant in small, irregular clusters and islands, not in large masses.
- Break up the continuity of the vegetation (fuel) with decorative rock, gravel and stepping stone pathways.
 This will help modify fire behavior and slow its spread across your property.
- Plant a variety of types and species.
 Besides being aesthetically pleasing, this will help ensure a healthier forest by reducing insects and diseases. Healthy, vigorous, thinned forests can better resist catastrophic fires than unhealthy ones with insect and disease problems.
- In the event of drought and water rationing, prioritize the plants you wish to save. Provide supplemental water to those nearest your home, perhaps using "gray water."
- Mulch to conserve moisture and reduce weed growth. Mulch can be organic (wood chips or small bark pieces) or inorganic (gravel or rock). Avoid pine

Conifers

In Colorado, conifers make up much of our natural forest. Because of their high resin content, they are more susceptible to fire.

Even though conifers are flammable, you do not need to remove all of them from around your home. Wildfire hazards usually can be effectively reduced through proper thinning and pruning of existing trees and shrubs.

When choosing conifers for your defensible space, consider those with characteristics that make them better able to survive fire:

- · thick bark,
- · long needles, or
- self-pruning. (Self-pruning trees lose lower branches naturally, leaving a greater distance between ground and canopy.)

bark, thick layers of pine needles or other materials that can easily carry fire.

Don't Forget Maintenance

A landscape is a dynamic, constantly changing system. Plants considered "fire resistant" and that have low fuel volumes can lose these characteristics over time. Your landscape, and the plants in it, must be maintained to retain their FireWise properties.

Be aware of the growth habits of the plants on your land and of the changes that occur seasonally. Keep a watchful eye for the need to reduce fuel volumes and fuel continuity.

- Remove annual, herbaceous plants after they have gone to seed or when the stems become overly dry.
- Rake up and dispose of litter as it builds up over the season.
- Mow or trim grasses to a low height within your defensible space. This is especially important as they begin to cure and dry.
- Remove plant parts damaged by snow, wind, frost or other agents.
- Timely pruning is critical. It not only reduces fuel volume but also maintains healthier plants with more succulent, vigorous growth.

Committee Presentation Partnership Presentation Partnership Partne

FIREWISE is a multi-agency program that encourages the development of defensible space and the prevention of catastrophic wildfire.

Additional FireWise Publications

Colorado State University Extension

The following publications are available from the University Resource Center, Colorado State University, 115 General Services Bldg., Fort Collins, CO 80523-4061; (970) 491-6198; ccs_resourcecenter@mail.colostate.edu. Printed copies cost \$1; they are available free on our website at www.ext.colostate.edu/pubs/pubs.html:

- 6.302, Creating Wildfire-Defensible Zones
- 6.303, Fire-Resistant Landscaping
- 6.304, Forest Home Fire Safety
- 7.402, Protecting Trees During Construction

Colorado State Forest Service

The following publication is available from the Colorado State Forest Service, Colorado State University -Foothills, 5060 Campus Delivery, Fort Collins, CO 80523-5060; (970) 491-6303:

• Home Fire Protection in the Wildland Urban Interface, CSFS #142-399
